## Acknowledgement of Assistance

All manuscripts utilizing data made available through the Consortium should acknowledge that fact as well as identify the original collector of the data. The ICPSR Council urges all users of the ICPSR Data facilities to follow some adaptation of this statement with the parenthesis indicating items to be filled in appropriately or deleted by the individual user.

The data (and tabulations) utilized in this (publication) were made available (in part) by the Inter-university Consortium for Political and Social Research. The data for FEDERAL STATE COOPERATIVE PROGRAM: 1975-1976 POPULATION ESTIMATES were originally collected by the U.S. Dept. of Commerce, Bureau of the Census. Neither the collector of the original data nor the Consortium bear any responsibility for the analyses or interpretations presented here.

In order to provide funding agencies with essential information about the use of archival resources and to facilitate the exchange of information about ICPSR participants' research activities, each user of the ICPSR data facilities is expected to send two copies of each completed manuscript or thesis abstract to the Consortium. Please indicate in the cover letter which data were used.

U.S. Dept. of Commerce. Bureau of the Census;  
FEDERAL STATE COOPERATIVE PROGRAM: 1975-1976 POPULATION ESTIMATES  
(ICPSR 7841)

This dataset contains estimates of the total population residing in all counties and county equivalents in the United States for July 1, 1975 and July 1, 1976. Also included are estimates of the components of population change (births, deaths and net migration) from April 1970 through December 1975. The data were compiled by the United States Bureau of the Census with the assistance of designated state agencies in the Federal-State Cooperative Program for Population Estimates.

The information included in this dataset was published for each county or county equivalent (e.g., parishes in Louisiana, census divisions in Alaska, and independent cities in Virginia and Missouri) by the Census Bureau. The published data appeared as Current Population Reports, Population Estimates and Projections Series P-25.

The file has 3,150 records, each of which has a logical record length of 72. There are five substantive variables. These data were acquired in machine-readable form from the U.S. Bureau of the Census with the assistance of Craig Harris, Department of Sociology, Michigan State University. Class III

Technical Documentation  
Federal State Cooperative Program  
1973 - 1978 Population Estimates

I. INTRODUCTION

These files present current estimates of the population for counties in each State. The estimates are prepared under the auspices of the Federal State Cooperative Program for Local Population Estimates. The objective of this program is the development and publication of estimates of the population of counties using standard procedures for data input and methodology.

The methods used in the preparation of these data have been tested against the 1970 census and special censuses. The decision on methodology was made jointly by the individual States and the Bureau of the Census on the basis of these tests. The Administrative Records method has been tested with special censuses since 1970 and has been incorporated for use at all levels of geography. For a more detailed description of the overall estimates program and an analysis of 1970 test results for methods other than the Administrative Records method, see Current Population Reports, Series P-26, No. 21, "Federal-State Cooperative Program for Local Population Estimates: Test Results April 1, 1970," April 1973. Summary results of tests of the Administrative Records method are presented in Current Population Reports, Series P-25, Nos. 649-698, and in detail in Series P-25, No. 699 (forthcoming).

The estimates contained in these files are published in Current Population Reports, Series P-26, "Federal-State Cooperative Program for Population Estimates." An example of the publication is provided as Appendix A.

Series P-26, No. 77-14  
Issued November 1978

## Estimates of the Population of Indiana Counties and Metropolitan Areas: July 1, 1976 (Revised) and 1977 (Provisional)

This report presents total population estimates for July 1, 1976 and provisional estimates for July 1, 1977, for counties and metropolitan areas prepared under the auspices of the Federal-State Cooperative Program for Local Population Estimates. The objective of this program is the development and publication of estimates of the population of counties using uniform procedures standardized for data input and methodology. The estimates shown here were prepared jointly by the Bureau of the Census and the Indiana State Board of Health. This agency was designated by the Governor to work with the Bureau of the Census in implementing and carrying out the Federal-State Cooperative Program.

Annual county estimates for July 1, 1971-1975 and provisional estimates for July 1, 1976, were published earlier in *Current Population Reports*, Series P-25 or P-26. The provisional estimates in the last report are superseded by the numbers published here.

The methods used in the preparation of this report have been tested against the 1970 census and recent special censuses. The decision on methodology was made jointly by the individual States and the Bureau of the Census on the basis of these tests. The Administrative Records method has been tested with special censuses since 1970 and has been incorporated for use at all levels of geography. For a more detailed description of the overall estimates program and an analysis of 1970 test results for methods other than the Administrative Records method, see *Current Population Reports*, Series P-26, No. 21, "Federal-State Cooperative

Program for Local Population Estimates: Test Results—April 1, 1970," April 1973. Summary results of tests of the Administrative Records method are presented in *Current Population Reports*, Series P-25, Nos. 649-698, and in detail in Series P-25, No. 699 (forthcoming).

The county estimates shown for July 1, 1976, are computed as an average of the following methods, adjusted to agree with the July 1, 1976 State estimate.

1. The Regression (ratio-correlation) method.<sup>1</sup> In the Regression method, a multiple regression equation is used to relate changes in a number of different data series to change in population distribution. The series of data used in the Regression method for Indiana are: a three-year sum of resident births ( $X_1$ ), a three-year sum of resident deaths ( $X_2$ ), elementary school enrollment in grades 1 through 8 plus elementary special and ungraded enrollment ( $X_3$ ), and automobile registrations ( $X_4$ ). The regression equation used for Indiana is given by

$$Y = 0.1318 + 0.2040X_1 - 0.0553X_2 - 0.0854X_3 - 0.2205X_4$$

<sup>1</sup>More detailed descriptions of the methods are given in *Current Population Reports*, Series P-25, Nos. 427 and 500. Modifications made to the methodologies for the current series will be given in forthcoming reports in Series P-25.

**2. Component Method II.**<sup>1</sup> This method employs vital statistics to measure natural increase and school enrollment to measure net migration. The estimates produced by Component Method II are specific to the population under 65 not residing in group quarters. To this population is added an estimate of the population 65 and over based on the change in Medicare enrollees from 1970 to the estimate date, the institutional and college population, and reported military population living in barracks.

**3. The Administrative Records method.**<sup>1</sup> This is a component method which uses individual Federal income tax returns to measure the intercounty migration of the nongroup quarters population and reported birth and death statistics to estimate natural increase. The tax returns are matched by Social Security number in the base year and the estimate year to determine the number of persons whose county of residence changed during the period. A net migration rate based on exemptions claimed by the matched cases is then applied to the total population. This estimate is made specific to the nongroup quarters population under 65 by excluding from the migration computations data relating to persons 65 and over as well as persons residing in group quarters. These estimates are then combined with the independent estimates of the population 65 and over used in the Component Method II estimate and the other components of population change—births, deaths, immigration, and the net movement between the military and civilian population.

The provisional July 1, 1977 estimates for large metropolitan counties were developed by adding to the 1976 estimates the average change between the 1976 and 1977 Component Method II estimates and the corresponding Housing Unit method estimates. In the Housing Unit

method, the estimates of the population are based on changes in the housing inventory which are derived from data on building permits issued and demolition records, or on electric meter connections. The provisional July 1, 1977 estimates for the remaining counties were developed by adding the change between 1976 and 1977 Component Method II estimates to the 1976 estimates. All counties were subsequently adjusted to agree with the provisional July 1, 1977 State estimate.

Table 2 of this report presents estimates of the population of metropolitan areas and metropolitan counties in the State. The titles and definitions of the standard metropolitan statistical areas (SMSA's) are those currently defined by the Office of Management and Budget, Executive Office of the President. Where an SMSA falls in more than one State (indicated in the SMSA title), information on the other State parts of the area can be obtained by referring to the P-26 report for that particular State.

Corresponding estimates for other States in the program will be published as they become available. The appendix table shows reports published to date for States in the 1976-77 series, together with those published for earlier years.

The 1970 census population for the State and counties shown on the table reflects all corrections to the census count made subsequent to the release of the official State figure. The only county with a correction of more than 500 is Marion County.

The estimates presented in the table have been rounded to the nearest hundred without being adjusted to the State total, which was independently rounded to the nearest thousand. Percentages are based on unrounded numbers. Births and deaths are taken from reported vital statistics from April 1, 1970, to December 31, 1976, with extrapolations through June 30, 1977. Net migration is the residual difference between net change and natural increase.

---

<sup>1</sup> See footnote 1 on page 1.
